ABSTRACT

High School and Beyond is a national longitudinal study of the cohorts of 1980 seniors and sophomores in the United States, intended to provide information on these students through early adulthood. It is part of a program of national longitudinal studies of American youth initiated in 1972. This base year student file includes information on 58,270 students from 1,015 public and private schools. The senior questionnaire contained 121 questions; the sophomore questionnaire contained 114 questions. The file includes information on: (1) personal background; (2) education; (3) work experiences; (4) postsecondary plans and aspirations; (5) school activities; (6) attitudes; and (7) verbal and non-verbal cognitive test scores from a nine-part battery for seniors and a seven-part battery for sophomores. This codebook contains information to help users working with the data. Each item presented in the codebook contains an item indicator (a sequential number indicating the order of the items on the tape), tape position of each item, and variable identifier (either a three-part descriptor that identifies a questionnaire item/composite or a mnemonic identifier for the remaining variables) for particular pieces of information. For each questionnaire item, the question and its response categories are included, along with the frequency count for the total sample. All other High School and Beyond data files can be merged with this student file. (SLD)

1. General Design

High School and Beyond is a national longitudinal study of the cohorts of 1980 high school seniors and sophomores in the United States. At this time (November, 1980) information on these cohorts at only one time point has been obtained, in Spring, 1980. It is intended that information will be obtained on these two cohorts through the period of early adulthood by means of periodic resurveys of subsamples of students surveyed in the base year.

High School and Beyond is part of a larger program of national longitudinal surveys of American youth initiated by the National Center for Education Statistics with the cohort of 1972 high school seniors (the National Longitudinal Study of the High School Class of 1972). That cohort has been followed through 1979 by means of four resurveys. The overall multi-cohort, multi-wave design is intended to make possible more powerful analyses of problems involving youth and problems involving education than would be possible with unrelated studies.

The kinds of comparisons that are possible now, and will become possible as additional waves of data are obtained for the 1980 sophomores and seniors, can be shown by use of Figure 1. The horizontal lines refer to the passage of calendar time, the vertical lines to cohort differences at the same point in calendar time, and the 45° lines to the movement of the same cohort over calendar time. Thus comparison of two points on a horizontal line means comparison of two cohorts at the same stage in their life cycle, comparison of two points on the same vertical line

means comparison of two cohorts at different life stages but at the same calendar time, and comparison of two points on the same 45° line means comparison of a cohort with itself at another point in calendar time. The data obtained in High School and Beyond (which will be referred to as HSB) are represented by points XB_{80} and YB_{80}. XB_{80} refers to data on 1980 seniors as seniors; YB_{80} refers to data on 1980 sophomores as sophomores. (E = "elder," Y = "younger," B = "base year.") The data represented by points EB_{72}, $E1_{72}$, $E2_{72}$, $E3_{72}$, $E4_{72}$ refers to the base year and four follow-up surveys of the 1972 seniors. These data are described in other publications of NCES. Until the existence of HSB, analysis was limited to comparison along the EB_{72}-$E4_{72}$ line, all consisting of data on the 1972 cohort at different time points. With HSB, comparisons are also possible between EB_{72} and EB_{80}, the 1972 and 1980 senior cohorts in the base year, and between EB_{80} and YB_{80}, the 1980 senior and sophomore cohorts in the base year. As additional data are obtained on these cohorts through resurveys, a number of additional comparisons will become possible, as suggested by Figure 1.

The number of students from the 1972 senior cohort which are included in one or more of the surveys of that cohort, and thus included in the public use file for that cohort, is 22,652 from 1,318 schools. The number of students from the two HSB cohorts is 58,270, from 1,015 schools.

2. Available Survey Data

Data for HSB were obtained primarily by means of questionnaires and tests. The several data sources are listed below.

2.1 Sophomore and senior questionnaires (see Appendix): Questionnaires were administered to sampled sophomores and seniors, covering a number of areas including background, school activities, out-of-school activities, attitudes, post-high school plans and aspirations. The questionnaires contain a number of items in common with the data on the 1972 cohort (see

Section 8), and there are a number of items in common between the sophomore and senior questionnaires.[1] Questionnaires were translated into Spanish, and students who requested or needed Spanish language questionnaires were administered the Spanish questionnaires.[2]

2.2 Tests (see Appendix for sample items): Test batteries were administered to sophomore and seniors, consisting of tests as described in the Appendix inside the covers of the senior and sophomore test booklets.

2.3 Second language information (see Student Identification Pages in Appendix): As part of a separate identification form designed to facilitate identifying the students for resurveys, students were asked questions about a second language. For those who gave a non-English response to any or all of questions 11 to 15, information about their exposure to and use of a language other than English was obtained through this set of questions.

2.4 Twin data When a twin was found in the sample, questionnaire and test were administered to the other twin as well. Data on about 500 pairs of twins were obtained in this way. Data from the non-sample twin is not included in the national sample; an additional file of the pairs of twins will be available for analysis.

---

[1] For the information of persons planning research on comparable populations, the items in these questionnaires, and the questionnaires as a whole, are in the public domain and can be used without permission. However, NCES would like to be informed of research using parts of the HSB instruments, for the potential value to other research investigators. HSB tests are not in the public domain because of the test security necessitated by future use of the same items in resurveys of the HSB cohorts. Further information about the tests can be obtained from NCES.

[2] Standard translation-retranslation methods were used in creating the Spanish questionnaires to insure that the original meaning was preserved. The number of students using a Spanish language questionnaire was 56.

2.5 Friend data (See Student Identification Pages in Appendix, question 5). Students were asked the names of their three best friends in the same class in school. Some of these friends will also have fallen into the sample. It is possible to link students with friends who did fall into the sample and thus carry out analyses with friendship pairs. That linkage has not currently been made, but may at a future date be carried out to make such analyses possible.

2.6 School questionnaire: The principal of each school was given a school questionnaire which obtained information about the school to be completed by the principal or the school staff.

2.7 Teacher's comment form: Teachers in the sampled schools were asked to respond to several questions in a special form to be returned by mail. Most of the questions concerned their knowledge of and evaluations of students in the HSB sample. This information will be useful primarily when merged with questionnaire and test data concerning the student.

2.8 Information on schools obtained from field staff reports: Field staff obtained both quantitative and qualitative information on sampled schools. Quantitative information includes completion rates on survey day and on make-up days. Qualitative information includes observations about the conditions under which testing and questionnaire completion took place. This information has not been coded, but may at a future date be coded and added to the school-level public use file.

2.9 Printed material from schools: From a large number of schools, field staff was able to obtain printed material giving information about school curriculum, school rules, school activities, and graduation requirements. Although this material will not be available for public use in order to protect anonymity of schools, it is available for special purposes in work carried out in cooperation with NCES. Investigators interested in use of these data should contact NCES for further information.

2.10 Parental information: A sample of parents of sophomores and seniors (about 3,500 for each cohort) has been drawn, and data are being collected through a questionnaire (mail, telephone, or personal interview). These data, which concentrate on financing of higher education, will be available for analysis with or without the student data.

3. Data Files

Most of the data described in section 2 will be processed and available from NCES in various files. The files are described below. Only File 1 is currently (November 1980) available; others will be available shortly.

File 1: Student File. National sample, sophomore and senior questionnaire and test data (see 2.1 and 2.2 above).

File 2: School File. School questionnaire data (see 2.6 above) are contained in this file. Merging with data from the Student File is possible through common identification codes.

File 3: Language File: File 1 contains an indicator (see section 7.2) for each student who reported some non-English language experiences (see section 2.3). File 3 contains this language usage information, with records only for these students.

File 4: Teacher Comment File: The information described in section 2.7, which is useful primarily when merged with data from the Student File, is contained in this file. The merge with student data is possible through the student identification codes.

File 6: Twin File: This file will be of the same format as File 1, and will contain student questionnaire and test data for both members of each pair of twins.

3.1. Suggestions for users. The data file has been prepared to facilitate use with standard statistical software packages. The necessary labels for use of the student data file with one of these packages, SPSS, have been incorporated into the public use files (see section 7.7). This "SPSS control card file" can also be used, with slight modifications, to provide the necessary labels for use of the SAS software package.

Whether using an existing statistical package or not, efficiency in processing requires attention to certain details. First, it is important to remember that the student data file is a large file, much larger than necessary for certain purposes. To reduce processing costs (which depend on the number of records and number of variables read from the file into the CPU of the computer), work files can be created which shorten the student data file in either (or both) of two ways. First, variables not needed for the analysis at hand need not appear in the work file, and second, for some purposes, a sample of the records will substitute for the total file. Sampling of records (e.g., by taking every Nth record) is especially valuable for multivariate analytical methods which require correlation matrices as the first step. A correlation matrix obtained from a random sample of students only a tenth the size of the total sample of 58,270 will be very close to that from the total sample.

Another measure to increase efficiency for multivariate analyses which require correlation matrices is to proceed in two steps: first, calculation of the correlation matrix, saving it for use with a number of analyses; then carrying out all these analyses from the same correlation matrix. It is the first step which is costly in the analysis, and proceeding in this fashion will allow that cost to be reduced.

In section 7.5, several composite variables are described. These composite variables have been created to allow direct comparability with the 1972 seniors, for which the same composites were constructed. However, many users will prefer to construct and use different composite variables. The computer software technology is now sufficiently developed that some statistical software packages allow this to be done easily and flexibly.

4. Sampling

4.1 Sample design: Students were selected through a two-stage probability sample with schools as the first stage units and students within schools as the second stage units. With the exception of special strata (to be described below), schools were selected with probability proportional to estimated enrollment (average of class sizes), and within each school, 36 seniors and 36 sophomores were randomly selected. In those schools with fewer than 36 seniors or 36 sophomores, all eligible students were drawn in the sample. This resulted in a sample that (with the exception of the special strata described below) was approximately self-weighting.

The total number of schools in the sample as designed was 1,122, from a frame of 26,095 schools with grades 10 or 12 or both.[1] Stratification was as follows:

---

[1] The sampling frame, defined as the universe of high schools in the United States, was obtained from the 1978 list of U.S. elementary and secondary schools of the Curriculum Information Center, a private firm. This was supplemented by the NCES lists of public and private elementary and secondary schools. Any school listed in any of these files which contained either a 10th grade or 12th grade or both was part of the frame.

Special Strata (oversampled)

Alternative schools	50
Cuban Hispanic (public)	20[a]
Cuban Hispanic (Catholic)	10[a]
Other Hispanic	106[a]
High performance private	12
Other non-Catholic private (stratified by 4 regions)	38
Black Catholic	30[a]

Regular Strata (not oversampled)

Catholic (stratified by 4 regions)	48
Public (stratified by 9 regions; racial composition; enrollment; central-city, suburban, rural)	808
	1,122

[a] These schools were defined as those having 30 percent or more of enrollment from the indicated subgroup.

The purpose of the special oversampled strata is to allow a sufficient number of cases for special analyses of sub-groups of students or schools.

4.2 Sample realization: Substitution was carried out for schools which refused to participate in the survey, but there was no substitution for students whose parents refused, who themselves refused, or who were absent on survey day and make-up days.[1] Substitution was carried out only within strata, and in certain cases no substitution was possible, because a school was the sole school in a stratum. The realization of the sample by stratum is given in Table 1.

---

[1] Apart from substitution for schools which refused, there were a number of schools in the originally-drawn sample which were "out of scope," failing to fit the criterion for inclusion of the sample. The sample was then augmented through selection of an additional school for each out of scope school, within major strata. Most of the out of scope schools were area vocational schools, having no enrollment of their own, although they were listed in the frame as having enrollments.

Table 1
High School and Beyond sample realization

Stage 1: Sampling of Schools				
Stratum	Drawn in sample	Original schools[1]	Substituted schools	Total realized
TOTAL	1,122	811	204	1,015
Public, regular	808	585	150	735
Public, alternative	50	41	4	45
Cuban public	20	11	—	11
Other Hispanic public	106	72	30	102
Catholic, regular	48	40	5	45
Catholic, black	30	23	7	30
Cuban Catholic	10	7	2	9
High performance private	12	9	2	11
Other non-Catholic private	38	23	4	27

Stage 2: Sampling of Students						
	Total drawn in sample	Absent, survey and make-up days	Student refused	Parent refused	Partial materials missing	Surveyed, in file
Number	69,662	8,278	1,739	223	1,132	58,270
Percent	100[2]	12	3	*	2	84

[1] Includes additional selections made when schools were found to be out-of-scope.

[2] The total adds to more than 100 percent because of rounding.

Weights for students consist of the product of the school weight as described above and a within-school student weight. The within-school student weight consists of the number of students in the class represented by this student (the inverse of the probability of being drawn), times the ratio of the number of students sampled in that school divided by the number for whom questionnaire data was obtained. As in the case of the school weight, the second stage weight involves two underlying factors, compensation for overall and differential selection probabilities with respect to the initially selected sample, and adjustment for bias components induced by differential response rates. It should be noted that the adjustment for bias due to non-participation/availability is only partial. What remains is any bias that might be due to overall differences between responders and non-responders.

The student weight described above and contained on the student file (see section 7) is the estimated number of students in grade 10 or 12 of American high schools represented by the student on whose record the weight appears. Since weights differ for students in different schools, it is important that weights be used in estimating any proportion or mean for American sophomores or seniors as a whole, or for any subgroups.

Use of weights should lead to correct estimates (within sampling error) of the population of 10th and 12th grade students in United States schools in spring, 1980, and correct estimates of subgroups within it. If comparison with other data sources strongly indicates that certain population estimates are too high or too low, further adjustment of weights may be carried out in future versions of public use files. Preliminary comparisons have shown that the current weights give estimates reasonably close to those from other data sources.

4.3 Weighting procedures: Although the sample design specified that students in all but the special strata would be selected with approximately equal probabilities, the probabilities are only approximately equal. In addition, the students in special strata were selected with higher probabilities, in some strata extremely so. The sample as realized also did not equal the sample as drawn, creating further deviations from a self-weighting sample. Weights have been introduced for schools and for students, which give each school or each student a weight equal to the number of schools or students in the universe of schools or students which that school or student represents.

Weights for schools were computed as the product of three factors. Factor one was the inverse of the probability of selection for the school under the assumption that it was part of the initial set of selections. Factor two was the estimated proportion of schools in the stratum which were "out of scope." This factor was used in order to compensate for the fact that the design specified that replacement selections were to be made for schools of this type. The final factor involved the ratio of the number of initially selected schools in each stratum to the final "in sample" schools from the stratum. This factor was employed to compensate for the differential cooperation rates (at the school level) across the various strata, and to adjust the total sample projections to reflect the total frame rather than only cooperating schools. It should be pointed out that refusals, as well as substitution for schools which refused, introduce some uncertainty into the sample, due to the unknown differences between schools which refused (some of which were substituted for) and the stratum as a whole.

4.4 Sampling errors: A complete description of sampling errors, including suggested formulas for exact computations, will be reported in a subsequent separate report on sampling. Approximate sampling errors for estimated percentages (and corresponding totals) and test score means may be computed as follows.

4.4.1. Percentages and corresponding estimated totals

An approximate standard error for a percentage p, may be derived by the following equation:

$$se(p) = deft \sqrt{p\ (100-p)/n} \qquad (1)$$

where

se(p) = the standard error of the percentage p,

p = the sample percentage (a number in the range 0-100),

n = the actual (unweighted) sample size for the subclass from which the percentage is developed,

deft = the deft factor for the appropriate year and subclass from Table 2. Deft is the square root of the design effect, deff. (deff = (actual variance)/(simple random sample variance)).

For example, the sample percentage of sophomores in the Pacific region who expect to go to college is 45.6 and the sample base of responding students for that region is 3,761. From Table 2, column 1, row 18, the deft factor is 1.6248. Therefore, by use of equation (1), the approximate standard error of this percentage is

$$\begin{aligned} se(p) &= 1.6248 \sqrt{45.6(100-45.6)/3761} \\ &= 1.3196 \end{aligned}$$

Table 2
Deft factors for percentages: sophomores and seniors

Subclass	Sophomores (10)	Seniors (12)
All students	1.6144	1.6203
Males	1.4172	1.4407
Females	1.4216	1.4221
White	1.4882	1.5251
Black	1.4640	1.3783
Hispanic	1.3932	1.4887
Public school Students	1.5287	1.5083
Catholic school Students	1.9419	2.0378
Other private school Students	2.5972	2.6889
New England	1.5834	1.6433
Mid-Atlantic	1.7834	1.6334
South Atlantic	1.6156	1.5740
East South Central	1.3968	1.5218
West South Central	1.6326	1.6762
East North Central	1.4878	1.5178
West North Central	1.3638	1.4519
Mountain	1.6788	1.6323
Pacific	1.6248	1.6678

Standard errors for the population projections corresponding to a percentage may be approximatedby

$$se(\text{estimated total}) = N\,(se(p)/100) \qquad (2)$$

where N = the appropriate projected total
population base for the percentage p, and

$$\text{Estimated total} = N\,(p/100) \qquad (3)$$

For instance, using the above example, the estimated total population base for this particular percentage is 455,172. With 45.6 percent of these sophomores expecting to go on to college, we find the projected total number of sophomores in the Pacific region who expect to enter college via equation (3):

$$\text{Estimated total} = 455{,}172\ (45.6/100)$$
$$= 207{,}558$$

The standard error of the population projection is calculated with equation (2). With the estimated total population base equal to 455,172 and the standard error of the percentage as calculated from equation (1), se(p) = 1.3196), the standard error of the estimated total is

$$se(\text{estimated total}) = 455{,}172(1.3196/100)$$
$$= 6{,}006$$

4.4.2. Standard errors for test score means

Approximate standard errors for test score means may be computed as follows:

Let $\bar{x}$ = the sample test score mean for a subclass in a specific test,

s^2 = the weighted element level sample variance computed for the subclass on this test,

n = the unweighted sample size for test score $\bar{x}$

deft = deft factor for the appropriate year and subclass from Table 3.

The standard error of the test score mean is

$$se(\bar{x}) = \text{deft}\sqrt{s^2/n} \qquad (4)$$

For example, the mean of the vocabulary test scores ($\bar{x}$) for male seniors is equal to 4.63 and the weighted element variance (s^2) is equal to 5.8505. The unweighted sample size (n) here is the total sample size minus the number of missing data cases and equals 11,438. Using Table 3, we find that the deft factor (in column 2, row 2) is 1.3838. Therefore, the standard error for male seniors' vocabulary tests, computed with equation 4, equals

$$\begin{aligned} se(\bar{x}) &= 1.3838\sqrt{5.8508/11438} \\ &= .03134 \end{aligned}$$

5. Field Procedures

The data were collected between February 1 and May 15, 1980. Sophomore and senior groups within each school on a given day met separately, and completed the questionnaires and tests in one session. A field representative was present with each group to explain survey procedures and to answer questions.

The first step for the students was to complete an identification booklet which provided information about how the student might be located if selected for future follow-up. To preserve student confidentiality these booklets were handled, shipped and stored separately from the other student instruments.

At the end of the identification section there was a series of questions designed to locate all students who had some exposure at home to a language other than English. For those students who did have other language exposure there was a special series of questions about that language. These data will be available in a separate file, identified as File 3 (see section 3).

All students then filled out the self-administered questionnaire. When the group had all finished the questionnaire (usually in about an hour) a member of the school staff administered the cognitive tests. While the students were taking the tests, field personnel spot edited the questionnaires for completeness of a subset of key questions.[1] Students were asked to provide any missing key information after they completed the tests. Since both participation in the survey and responding to any particular item were completely voluntary, students were given the option of marking a special oval to indicate that they preferred not to answer a question.

School staff usually conducted a series of make-up days if any sample students were absent on survey day. To preserve the confidentiality of student data these questionnaires were not subject to spot edit.

All student questionnaires and tests were optically scanned. The questionnaire data was machine edited after scanning, and any key items which students had neither answered nor indicated that they preferred not to answer were flagged. Editors attempted to retrieve this flagged information by telephone.

6. Data Preparation

6.1 Editing and response consistency:

The student questionnaires and tests were designed to be optically scanned to eliminate error in

---

[1] Sophomore key questions were numbers 1, 3, 6, 7, 9, 13, 14, 17, 18, 36, 38, 39, 41, 42, 68, 69, 75, 88, 90, 91, 100. Senior key questions were numbers 1, 2, 4, 7, 11, 14, 16, 17, 36, 38, 39, 41, 42, 62, 65, 71, 79, 87, 89, 90, 101.

Table 3
Deft factors for test scores: sophomores and seniors

Subclass	Sophomores (10)	Seniors (12)
All students	1.9971	1.7314

7. Organization and Contents of the Data Files

The Student Data File consists of 58,270 records. The physical tape consists of four files, in the indicated order:

1) Student Data File (BLKSIZE=12,300; LRECL-1025)
2) Machine Readable Codebook (BLKSIZE=6,000; LRECL=60)
3) SAS Control Card File[1] (BLKSIZE=6,000; LRECL=60)
4) SPSS Control Card File[1] (BLKSIZE=6,000; LRECL=60)

Sections below refer to the Student Data File. The variables are grouped by type and are positioned on the Student Data File in the following order:

1. identification codes
2. data indicators
3. adjusted student design weight
4. student questionnaire data
5. composite variables from the student questionnaire data
6. test scores
7. attitudes about testing (seniors only).

7.1 Identification codes: The first variable on the file is a two-digit record identification code (RECDTYPE). The code for the student data file is 04. Next is a one-digit variable identifying the school sample type (SCHLTYPE) followed by a random four-digit school code (SCHOOLID) and a two-digit student code (STUDNTID). The school code is used to group together students from the same school. The school code combined with the student code forms a unique code (CASEID) for identifying individual records.

---

[1] The SAS and SPSS Control Card files are designed to be used with the standard statistical packages (SAS = Statistical Analysis System; SPSS = Statistical Package for the Social Sciences) by containing the control cards used by these systems.

the transfer of data from the instruments to machine-readable form and to make the data available to users in the shortest possible time. Checks on data quality were carried out in the data collection procedure, the optical scanning operation, and the telephone follow-up effort.

The editing and response consistency checks were relatively simple because the questions and responses in the student questionnaire were designed so only one explicit skip pattern appears in the senior questionnaire (seniors not going onto college do not complete the last section on college education), and none in the sophomore questionnaire. In the case of two or more related questions, the question(s) following the implicit screening question contains a response appropriate for those respondents "screened out" by the first question in the series of related questions. No inter-item consistency checks have been carried out for the implicit screener questions.

6.2 Error and missing data codes: To facilitate the comparison of the 1980 High School and Beyond data with that of the 1972 NLS, the error and missing data codes defined for the 1980 data file correspond to those used with the 1972 NLS data file. The codes on the 1980 data file are as follows:

6 - Multiple response. More than one response where only one response was called for.

7 - Refusal. The respondent refused to answer an item either at the time of questionnaire administration or telephone follow-up.

8 - Nonresponse. No response to an item other than a legitimate nonresponse or skip.

9 - Legitimate nonresponse. Based on a preceding response, the item should not be answered. This applies only to the questions regarding college in the senior questionnaire.

These codes apply to variables with single column data fields. For variables with data fields greater than one column, the leftmost columns are 9 filled (e.g., 96, 996, 9996, 99996).

Other variables identify the grade level (GRADE) (one-digit, sophomore = 1, senior = 2), the school's geographic region according to the nine U.S. Census regions (CENRGN, one digit) and the language (English = 0, Spanish = 1) in which the questionnaire was written (SPANLANG).

7.2 __Data indicators__: The variable TESTDATA (1 = included, 0 = not included) indicates whether or not test data are included in this student's record on the data file. Two other variables indicate the availability of additional data on separate files. The availability of non-sample twin data and non-English language usage data are indicated by the variables TWINDATA and LANGDATA (1 = available, 0 = not available on each indicator) respectively.

7.3 __Adjusted design weight__: The variable DESIGNWT is a 15 digit number representing the adjusted student design weight. The form of the number is 4 integers, decimal, and 10 decimal places. A description of this variable was given in section 3.3 above.

7.4 __Student questionnaire data__: The senior questionnaire contains 121 questions and the sophomore questionnaire contains 114 questions. Eighty-nine questions are common to both questionnaires so that the number of unique questions from the two questionnaires is 146. This section of the data file contains data from both questionnaires. The general order of the data follows that of the senior questionnaire with unique sophomore data interspersed among the senior data so that sophomore data remain in the same order as in the questionnaire. A description of the identification code used to identify the common and unique variables is provided in the guide to the codebook, section 8.

7.5 *Composites* The composites on this data file have been constructed to be comparable to those contained on the 1972 NLS public use file. They consist of an SES raw composite (BBSESRAW), a trichotomous SES status measure (BBSES), a measure of self-concept (BBCONCPT) and locus of control (BBLOCUS), and orientation to work, family, and community (BBWORK, BBFAMILY, BBCOMMUN).

The procedures used in developing these measures except for BBSES were as follows. Each item used in a given composite was standardized within grade to a mean of 0 and standard deviation of 1. Then standardized items were summed to give the composite measures.

The trichotomous SES measure was formed by giving a score of 3 to the highest quartile in the BBSESRAW, a score of 2 to the two middle quartiles, and a score of 1 to the lowest quartile.[1]

7.6 *Test battery data*: The senior test battery consists of the following nine parts:

Vocabulary (2 parts)
Reading
Mathematics (2 parts)
Picture-Number
Mosaic Comparison (2 parts)
Visualization in Three Dimensions

The sophomore battery consists of seven parts:

Vocabulary
Reading
Mathematics (2 parts)
Science
Writing
Civics Education

---

[1] Items used for the composites are:

BBSESRAW, BBSES: BB038, BB039, BB042, BB101, BB104b-BB104i
BBCONCPT: BB058 A, C, D, H
BBLOCUS: BB058, B, E, F, G
BBWORK: BB057 A, C, E
BBFAMILY: BB057 B, H, I (BB0571 with *negative* weight)
BBCOMMUN: BB057 F, G, J.

Procedures described in the text are those used for the 1972 NLS public use file.

There are a number of vocabulary, reading, and mathematics items that are common to both the senior and sophomore tests. Items from each section have been grouped together to form three subtests which contain comparable senior and sophomore test data.

The sophomore, senior, and common sections combined make up 19 tests or subtests (9 senior, 7 sophomore, 3 common). For each part the following data are provided: the number right, the number wrong, the number not attempted,[1] a formula score; a weighted standardized score with a mean of 50 and a standard deviation of 10.[2] For seniors only, there is a short section containing information concerning attitudes about testing (see Appendix).

7.7. Technical specifications:

NCES has organized the HS&B data tapes to promote access and simplify analyses. Users have four basic options from which to choose:

Option 1 - Acquire the raw data files written in EBCDIC or BCD code. Included are SAS (Statistical Analysis System) and SPSS (Statistical Package for the Social Sciences) control cards, and a codebook print file which presents unweighted frequency distributions for all discrete variables.

Option 2 - (IBM users only) Obtain an SAS System file and the codebook described above.

Option 3 - (IBM users only) Obtain an SPSS Archive System file and the codebook described above.

Option 4 - Have NCES subset the files, i.e., select certain subpopulations and/or variables according to user specifications. The codebook and control cards described in Option 1 will also be provided.

---

[1] The "number not attempted" is used here to mean the number of items in that test to which no answers were given; it includes items skipped and items not reached.

[2] Standardization of tests was carried out over the weighted sample for each grade separately, except for the three subtests with common items for sophomores and seniors (BBVOLSD, BBREADSD, BBMATHSD), which were standardized for both grades together.

The basic cost for any option is $120 for the first reel of tape and an additional $20 for each additional reel required (see Table 4 below). Costs under Option 4 will be a function of computer time, programmer time and the number of reels of tape produced. (Minimum charge will be $120.)

Table 4
Costs for ordering High School and Beyond data tapes by various tape recording densities and options

Options	Tape Recording Densities (BPI)		
	800[a]	1600	6250
1 (Raw files)	$180[b]	$140	$120
2 (SAS System file)	—[c]	$160	$120
3 (SPSS Archive file)	—[c]	$180	$140
4 (Subsetting)	(Estimates available upon request)		

[a] The numbr of reels of tape required is a function of the tape density at which the various options are recordd.

[b] Available as 7-Track, BCD files or as 9-Track EBCDIC files.

[c] Not available.

The SAS and SPSS control cards and the codebook will be "stacked" as separate files on the tape(s) containing the data files. Users will be given explicit IBM JCL (Job Control Language) instructions on how to read each file.

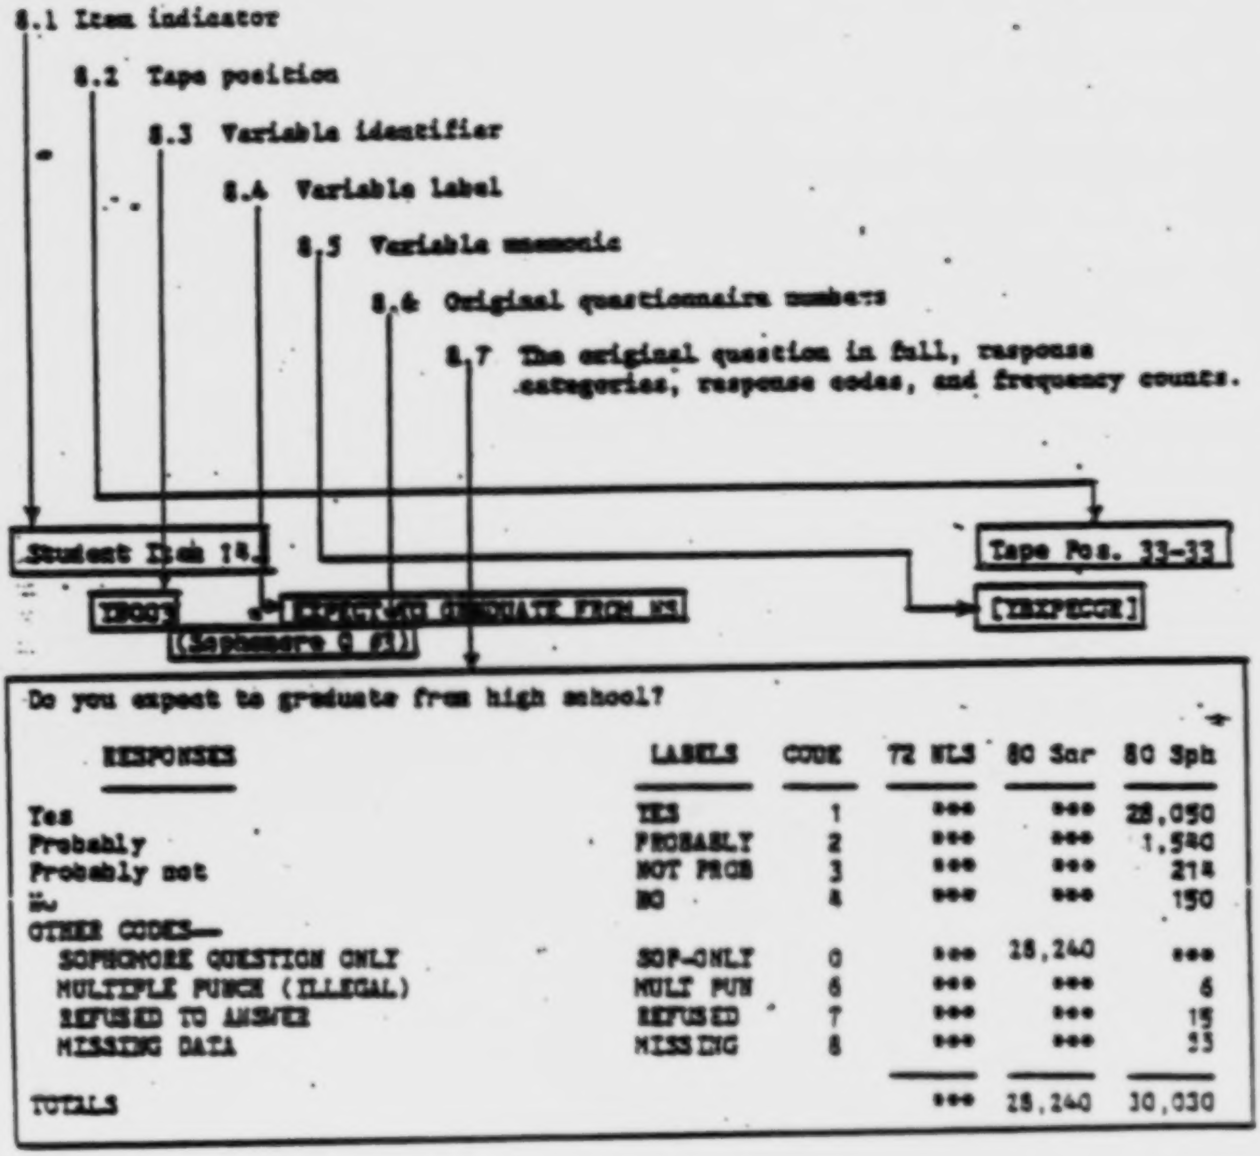
8. Guide to Codebook

The codebook provides comprehensive information about the Student File to aid the user in working with the data. For each questionnaire item, the complete original question and its response categories are printed along with frequency count for the total senior sample and the total sophomore sample. The original question numbers from the sophomore and senior questionnaires and from the 1972 NLS (if a comparable question was asked in 1972) are also included. A description of the contents of the codebook follows. Information indicated in sections 8.1 - 8.7 below is given for each item. A sample item from the codebook, with indications of the locations of particular pieces of information, is shown below.

8.1 Item indicator: The item indicator is a sequential number indicating the order of the items on the tape.

8.2 Tape position: For each item on the tape its corresponding tape position is given.

8.3 Variable identifier: The variable identifier is either a three-part descriptor which identifies a questionnaire item or composite or a mnemonic identifier for the remaining variables. The mnemonics give an indication of the variable's meaning; for example, RECDTYPE identifies record type and CENRGN identifies census regions. In the codebook, the variable is described more fully by the variable label (see section 8.4).



8.1 Item indicator

8.2 Tape position

8.3 Variable identifier

8.4 Variable label

8.5 Variable mnemonic

8.6 Original questionnaire numbers

8.7 The original question in full, response categories, response codes, and frequency counts.

Student Item 18.

Tape Pos. 33-33

YB007

EXPECT TO GRADUATE FROM HS

[YBEXPECGR]

(Sophomore Q #1)

Do you expect to graduate from high school?

RESPONSES	LABELS	CODE	72 NLS	80 Snr	80 Sph
Yes	YES	1	***	***	28,050
Probably	PROBABLY	2	***	***	1,540
Probably not	NOT PROB	3	***	***	214
No	NO	4	***	***	150
OTHER CODES—					
SOPHOMORE QUESTION ONLY	SOP-ONLY	0	***	28,240	***
MULTIPLE PUNCH (ILLEGAL)	MULT PUN	6	***	***	6
REFUSED TO ANSWER	REFUSED	7	***	***	15
MISSING DATA	MISSING	8	***	***	55
TOTALS			***	28,240	30,030

For each sub-section of the tests, five composite variables were constructed as described in section 7.5 above. The variable identifiers for the test composites include the instrument identifiers (E, Y, and B), the year of the study (B), a four character mnemonic identifying the section and part of the test (VOC1, for the vocabulary section, part 1; READ, for the reading section and so forth), and the characters identifying the type of test composite. Examples are listed below.

YBVOC1RT Sophomore vocabulary—number right

YBVOC1WG Sophomore vocabulary—number wrong

YBVOC1NA Sophomore vocabulary—number not attempted

YBVOC1FS Sophomore vocabulary—formula score[1]

YBVOC1SD Sophomore vocabulary—weighted standardized score

As with the other composites, the variable is described more fully by the variable label in the codebook.

8.4 Variable label: A short variable label appears after the variable identifier. This label is the same as that which appears on the SPSS data definition card file.

8.5 Variable mnemonic: An alternative variable mnemonic appears in brackets following the variable label. This is a suggested mnemonic and is not part of the SPSS data definition card file.

8.6 Original questionnaire numbers: Reference to the question number in the original instrument(s) appears in parentheses below the variable information. If the question appears in both the senior and sophomore questionnaires, both question numbers are given. Also, if the question is identical to one that appears in the 1972 NLS base year questionnaire, the 1972 question number is given.

---

[1] The formula score is the raw score corrected for guessing. The standard correction factor, applied here, is (number right) - (number wrong)/(number of choices in each item - 1).

The three-part descriptor identifies a) the questionnaire on which the item is found; b) the year of data collection; and c) the question number. The variable descriptor varies from 5 to 8 characters depending on the complexity of the question.

a) The first character (left justified) indicates the source of the question.

E—Senior (Elder)
Y—Sophomore (Younger)
B—Common to both senior and sophomore questionnaires or tests (Both)

b) The second character indicates the year the data were collected. For the base year 'B' is the code.

c) Characters three through eight indicate the question number.

If the question appears only in the senior questionnaire or only in the sophomore questionnaire, then the number in the variable identifier is the same as that on the questionnaire. For example, question number 3 in the sophomore questionnaire is unique to that questionnaire and is identified as YB003. If the question appears on both the senior and sophomore questionnaires, then the variable identifier uses the question number from the senior questionnaire. For example, question 2 in the Senior questionnaire and question 1 in the sophomore questionnaire are identical questions. The variable identifier in the codebook is BB002, the question number in the senior questionnaire. (The question number in the Sophomore questionnaire is also listed.)

The composites constructed from questionnaire items are available for both sophomores and seniors. The variable identifier begins with BB and includes a short mnemonic. Examples are BBSES for the SES composite and BBCONCPT for the self-concept composite (see section 7.5).

8.7 The original question in full, response categories, response codes and frequency counts: Following the above information for a given item, the original question and response categories are reproduced in full, together with the response category codes and the unweighted frequency counts. This section of the code book is self-explanatory and is similar in layout to standard SPSS or SAS frequency tables with the addition of the complete question appearing next to the frequency counts. In the case where the question appears in more than one instrument and there is slight variation in wording (or context) among the instruments, a cautionary note is given. The user, however, should always check questions in the original questionnaires (see Appendices) to be sure they are suitable for the intended use.

CODEBOOK

Student Item 1. Tape Pos. 1-2

RECDTYPE = RECORD TYPE

IDENTIFICATION FIELD. The Identification fields are taken from the title page of the instruments or from the sample selection file.

RESPONSES	LABELS	CODES	72 NLS	80 Snr	80 Sph
{RECORD TYPE FOR STUDENTS}	STUDENT	04		28,240	30,030
TOTALS				28,240	30,030

Student Item 2. Tape Pos. 3-3

SCHLTYPE = SCHOOL SAMPLE TYPE

IDENTIFICATION FIELD. The school sample type code was taken from the sample selection file.

The next questions ask about your parents or guardians. Please answer for those parents with whom you are now living. For example, if you have both a natural father and a step-father or other male guardian, answer for the male who lives in the same household with you. If you are living with neither, use the category—'Do not live with father (stepfather or male guardian).

Please answer for the same persons in later questions that ask about your father or your mother.

Student Item 208. Tape Pos. 267-268

BB038 = FATHER'S OCCUPATION [BBFTHOCC]
(Senior Q #38 — Sophomore Q #38 — 72 NLS Var. BQ25B)

Please describe below the job most recently held by your father (stepfather or male guardian), even if he is not working at present.
